How the AppGameKit Visual Editor Works

The Media

Visual Editor imports your projects media files and allows you to drag & drop them into the main editor window. From there you can visually modify the media with controls to re-position, scale, rotate, set properties, duplicate and more.

Setting Object Properties

Visual Editor provides an easy way for object properties to be set up. You simply click on an object and its current properties will be displayed; you're then able to easily change any of the starting values for that object.

Properties 🔍 ✕

The sprite properties you can configure are:

- Depth

- Flip Vertical
- Flip Horizontal
- Colour
- Alpha
- Physics - 9 settings
- Collision Shape

- Custom values

You can also add in Text and Edit Box objects.

Multiple Scenes

Most apps will have more than one game scene (main menu, game play, game over, high score, etc). This is where the Visual Editor scene manager helps you. Simply choose a scene and design the items that need to appear within it.

Cross Device Testing

With the multiple resolution support you can preview how your app will look on different devices that have varying resolutions and aspect ratios. You choose a base resolution and from that the Visual Editor will re-scale and re-position your sprites across the various, different resolutions. You can also make adjustments in any resolution to ensure your app looks the best on any device.

Exporting and testing

The AppGameKit Visual Editor integrates with the Tier 1 IDE allowing you to instantly test your visual projects. A project file is exported which you can then modify with your own code to bring your game logic to life. For Tier2 C++ developers a template project is provided.

It is not supported anymore and it is full of bugs. It is an abandonware. Just wait for AGK3 or AGKStudio or something and see if it is worth your money or not. Really, avoid this....
